Summary

Final-year Informatics undergraduate (GPA 3.61/4.00) focused on frontend and web development. Build a Laravel and MySQLweb application that replaced a paper-based civil-registry workflow, and a Flutter monitoring app taken from wireframes and navigation map through to a shipped interface running on both Android and the web. Comfortable with JavaScript, ReactJS, PHP, and Laravel, HTML and CSS and use to wiring interfaces to REST APIs and relational databases. keen on UI/UX and looking for a frontend or web developer role where I can turn design into fast, reliable interfaces.

Education

Gunadarma University

Bachelor of Informatics · GPA 3.61 / 4.00 · Semester 8

Relevant coursework: Software Engineering, Database Systems, Machine Learning, Game Development, Web Programming, Human-Computer Interaction.

West Java, Indonesia

Sep 2022 – Present

Kartika X-1 Senior High School

Science Major · Final score 85.25 / 100.00

South Jakarta, Indonesia

2019 – 2022

Projects

SecureHome — IoT Home Security System

2025 – 2026

Undergraduate thesis · ESP32 (C++/Arduino), ESP32-CAM, RFID/NFC, Flutter, Supabase (PostgreSQL)

- Built a two-board system: an ESP32 controller handling contactless-card authentication, magnetic door sensing, PIR motion detection and a latching siren, paired with an ESP32-CAM that captures and uploads a snapshot the moment it is triggered.
- Designed three security modes so the same physical event draws a different response, removing false alarms caused by residents moving at home without weakening door or card protection.
- Modelled the PostgreSQL schema and enforced per-user isolation with Row Level Security, then proved it by negative testing from a second account: no cross-account read or write was possible.
- Developed the Flutter monitoring app covering authentication, mode control, event history, card management, and a live camera view, all served over HTTPS from the cloud backend.

Automated Traffic Violation Detection — YOLOv8 and EasyOCR

2025

Undergraduate research · Python, YOLOv8, EasyOCR, OpenCV, Jupyter Notebook

- Trained a three-class YOLOv8 detector for helmet, no-helmet and licence plate on an annotated dataset, reaching 87.6% average detection confidence.
- Built an EasyOCR reading stage that recognises plate characters across black, white and red plate variants with an 81.3% success rate.
- Integrated detection, character recognition, database logging and voice notification into a single near real-time pipeline aimed at strengthening Indonesia's electronic traffic law enforcement.

Si-PANDU — Integrated Administrative Service System

2024

Academic team project · PHP, Laravel, MySQL

- Digitised manual civil-registry workflows for marriage, birth and death certificates, removing the paper hand-offs that caused lost documents and slow verification.
- Automated data entry and validation to cut repetitive work for a small administrative team, and let residents submit and track applications online instead of queueing with hard copies.

Skills & Interests

Programming: Python, Java, C#, C++ (Arduino), Dart, PHP, JavaScript, SQL

Frameworks & Tools: Flutter, Laravel, ReactJS, NodeJS, PlatformIO, OpenCV, YOLO, EasyOCR, Anaconda, Jupyter Notebook

Databases: PostgreSQL, MySQL, Oracle, MongoDB, Supabase

Concepts: Relational database design, REST APIs, row-level access control, UML modelling, IoT firmware, computer vision

Soft Skills: Problem solving, time management, leadership, teamwork, creative thinking, adaptability

Languages: Bahasa Indonesia (native), English (intermediate)

Interests: UI/UX design, game development, machine learning, Internet of Things
